HERE IS A ROSE THAT COMES NEARER TO BEING A WHOLE ROSE GARDEN IN ITSELF THAN ANY VARIETY IN EXISTENCE

PLANTS are of vigorous, upright growth with extraordinarily heavy canes.

FOLIAGE is shining and holly-like, superior in every way to nine out of any ten Hybrid Tea Roses you have ever grown in your garden or that you are likely to see elsewhere.

BLOOMS are perfect in form, very large and are long lasting when cut. From the opening of the bud to full bloom they have the freshness that characterizes all flowers in the early morning.

Dawn-like Colors

We believe that this is the most beautiful Rose ever introduced in America. It has the shimmering iridescence of a Rainbow, compelling the instant admiration of everyone who sees it. Buds of canary yellow with cerise-picotée border slowly open to flowers of immense size and perfect form. The colors change as the flowers unfold—canary yellow, pale gold, cream, ivory, and alabaster white with the cerise edging of the petals passing through soft rose to a true apple blossom pink, and finally to the softest of soft pink lavender.

THE HIGHEST-SCORING ROSE IN THE HISTORY OF ALL-AMERICA ROSE TRIALS

It's Over! Now What?

WE ARE enjoying the first Peace-time gardening year since Pearl Harbor. Looking back, we feel certain that the Victory Gardening activities of our people represented one of the really great American efforts of the war. Food literally *did* Fight for Freedom, and had it not been for the astonishing production of our community and home gardens, a very serious food situation would have developed.

In Industry reconversion represents a major problem. It is a problem that every gardener also faces, and if we may be privileged to guide the thinking of our customers in Peace as we did in War, then we urge you to think along the lines of continuing your Victory Gardening. The need for a conservative home production of vegetables still exists; the returns from such production merit your most careful thought, for you have learned that your garden produces something that money cannot buy in the markets—health, happiness, and a justifiable and honest pride that comes from worthwhile accomplishment.

Breck's urges a three point plan for 1946 gardening:

- (1). A continuance of vegetable growing on a genuinely selective basis.
- (2). Reconversion of the garden plot, yard beds, or other cultivated areas, so that the joys of outdoor living among the flowers can be greater and ever more colorful.
- (3). A return to ornamental gardening which involves the improvement of long neglected lawns, flower beds, shrubbery-borders and hedges.

In this catalog, the pages are filled with a multitude of things that will make your home life richer and happier. One does not have to travel to see the beautiful flowers of the world. These you can have in your own garden; you can grow them yourself. Arouse in your family circle a pride in your garden, an interest in working there, and a joy in playing in it. Carry this garden message out to your neighbors; enter into friendly competition with them in the growing of fruits, vegetables and flowers; create community spirit, and by so doing, help build America back to a peace-time way of living and thinking.

WE WISH YOU EVERY SUCCESS IN THE COMING YEAR

CLOVER, White Dutch (*Trifolium repens*). This is the Clover which has been used so widely in lawn grass mixtures. Desirable as a golf putting green grass and as an important lawn seed mixture ingredient. Prepaid, Lb. \$2.00, 5 lbs. \$9.50, 10 lbs. \$18.00, 25 lbs. \$42.00

FESCUE, Chewing's (*Festuca rubra var. fallax*). KENTUCKY BLUEGRASS (*Poa pratensis*). A very valuable grass for lawns and permanent pastures on soils that are fairly rich and which have an alkaline reaction. Kentucky Bluegrass germinates and matures slowly and the resulting turf is not fully developed until it is at least four years old. (It does not reach perfection as a pasture grass until it is two years old.) For lawns, combine it with other varieties which develop more quickly but which are gradually crowded out by this long-lived and really permanent grass. Weight, 28 lbs. per bushel. Prepaid, Lb. \$1.00, 5 lbs. \$4.75, 10 lbs. \$9.00, 25 lbs. \$21.00

ORCHARD GRASS (*Dactylis glomerata*). An excellent, fibrous-rooted perennial grass which thrives well on light, sandy soils. Particularly valuable on hilly slopes that wash badly, where its roots when established penetrate deeply, preventing erosion. Withstands droughts better than most species. Not desirable for lawn purposes, but an excellent pasture grass; makes excellent hay when combined with Red Clover. Prepaid, Lb. 65c., 5 lbs. \$2.95, 10 lbs. \$5.75, 25 lbs. \$13.75

WHEAT, Marquis Spring. Wheat is, of course, the grain that is most largely used in the manufacture of products for human consumption. It is also of value as a feed for livestock, but in our section of the country it is grown for hay, for its straw which is used for bedding livestock, and for a green manure crop. This variety is a heavy cropping type for Spring planting. The kernel is dark red, hard, and plump. It is beardless, with smooth yellow chaff, and it is particularly valuable because of its earliness. Sow at the rate of 1 lb. to 200 square feet, or 2 bushels to the acre. Not prepaid, 15 lbs. (pk.) \$1.25, 30 lbs. \$2.25, 60 lbs. (bu.) \$4.00

Banks and terraces are often a part of the lawn surface around a house. The grasses used in Bank and Terrace Mixture will meet all conditions of drought and torrential rain.

The finest mixture of quality grasses for the home lawn that money can buy. It is made up of fast growing varieties which will start quickly and produce a fine close lawn within a few weeks, together with such permanent grasses as Colonial Bent and Cheiving's Fescue which gradually replace the former to form a turf which will last for years, if given reasonable care. This permanent lawn will have a fine even texture of the richest green color; it will stand the severest cold of Winter and withstand the heat of Summer. Breck's "Velturf" is guaranteed to contain no crabgrass seed and because of the luxuriant close textured turf when established crabgrass has little chance for survival. We recommend this grand grass seed mixture highly.

This mixture must not be expected to grow in clear sand but it will thrive under conditions too severe for other grass seed mixtures.

VEGETABLE PLANTING CHART

In order to simplify the planning of your garden and so that you may have your seed requirements on hand in good season, we have prepared the following vegetable planting table. The dates given must by necessity be approximate for weather conditions vary so from year to year that hard and fast rules in regard to times of planting are impossible. However, unless the season is unusually late they may be followed with reasonable assurance of safety. Our estimates on the number of plants or the length of row that an ounce or a pound of seed will produce, are moderate. In many cases many more plants will result and if great care is taken in handling, the seed will sow a row longer than that specified. ● In spite of variations such as are mentioned above we believe that you will find this chart helpful.

BRECK'S VEGETABLE SEEDS

BEANS

Underlined items are those which we particularly recommend

Asparagus—Mary Washington

ASPARAGUS

Asparagus is a hardy perennial plant which will bear a satisfactory crop over a 20-year period if the bed is properly established and cared for. We recommend the purchase of **ASPARAGUS ROOTS** (offered below) rather than seeds for the fussy work of starting, transplanting and selection are thus eliminated and above all, a crop may be harvested at least 2 years earlier.

If seed is used sow it thinly in drills, in the early Spring and cover to a depth of only $\frac{1}{2}$ inch. The resulting plants should be thinned out to stand at least 6 inches apart and when a year old transplant them to carefully prepared and heavily enriched beds.

1 ounce of seed will sow about 60 feet of drill

5012 Paradise. A fine new variety that produces a normal crop a year earlier than "Washington," with a heavier yield. Delicious, mild flavored, tender green stalks. Pkt. 25c., oz. \$1.00

5015 Mary Washington. The stalks are dark green with purplish tips. Very large, straight, and of superb quality. Immune to rust. Pkt. 15c., oz. 50c., $\frac{1}{4}$ lb. \$1.50

Time to Plant—Seed of most BUSH BEANS may be sown about May 1 with later plantings until about August 1; DWARF SHELL BEANS from May 1 to about June 20 and POLE SNAP BEANS from May 1 to July 5. LIMA BEANS should not be planted before May 15 with later plantings of the Bush varieties until about June 20 and until about June 10 with the Pole varieties.

Planting—Plant BUSH BEANS in rows about $2\frac{1}{2}$ feet apart and cover the seed to a depth of about $\frac{1}{2}$ inch. POLE BEANS should be planted in hills with a stout pole, 6 feet or more long in the center of each hill. These hills should be arranged in rows and spaced about 2 feet apart in the row. Leave about 4 feet between the rows to admit plenty of air and light. Two or three plants should be allowed to each pole.

1 pound of BUSH BEANS will sow a row of about 50 feet; 1 lb. of POLE BEANS (except Limas) will plant about 200 hills; and 1 lb. of LIMAS, about 75 hills

BEETS

Time to Plant—Sow quite early in the Spring (about April 20) and at intervals, from then until about July 25.

Soil Preparation—A light, rich soil is best. Do not use fresh manure for it will cause the roots to become scabby. Old, well rotted manure well mixed with the soil is excellent; also a standard vegetable fertilizer with a high potash content.

Planting—Sow the seed thinly in rows and later thin out so that the plants will stand about 2 inches apart. Allow about 1½ feet of space between rows.

1 ounce of seed should sow a 50-foot row

5272 Crosby's Egyptian, Breck's Arlington Strain. 50 to 55 days. This strain is unequalled for its fine shape, color and quality. The roots are uniform in appearance with small tops and slender tap-roots. For table use, and therefore for growing in the home garden, we recommend it unreservedly.

CELERY

For the early crop seed should be sown in a greenhouse during March, in flats. The late or main crop should be sown in a coldframe or even in a sheltered seed bed out of doors, in late April or during May.

Broadcast the seed thinly over the surface of the soil and cover very lightly (no more than 1/16 inch) with finely sifted soil. As soon as the plants are large enough to handle thin out so that they are an inch or two apart.

The early plants should be transplanted to permanent positions in the garden in May and the late crop in late June or July. Set the plants about 8 inches apart, in rows and allow at least 2 1/2 feet between rows. Celery should have a deep, rich, fertile soil which is well-drained. It should have an abundance of moisture.

1 ounce of seed should produce 3000 plants

SWEET CORN

Time to Plant—Sweet Corn is a rather tender plant and therefore seed should not usually be planted until about May 1 and then only if the weather is settled and reasonably warm. Plantings may be made at intervals, from that time until about July 1 using early varieties for the later sowings.

Seed Sowing—In the home garden it is best to sow Corn in rows which should be spaced about 3 feet apart. The seed should be sown very thinly; covered to a depth of one inch and the resulting plants thinned to stand about one foot apart. In larger field plantings the usual practice is to plant in hills spaced at least 3 feet apart each way. Four or five plants are allowed to each hill.

HERBS for Flavor and Fragrance

8123 Anise (Annual). A nice appearing plant with finely divided foliage somewhat resembling Fennel. The tiny yellowish white flowers borne in lacy umbels, appear about 3 months after seed is sown and the seeds are ready for harvesting about one month later. These seeds are used for flavoring many foods such as soups, salads or breads, and also produce an oil which is used in cough medicines.

Pkt. 15c., 3 pkts. 35c.

8145 Sweet Basil (Treat as Annual). An easily grown and popular culinary herb; a branching plant which bears whorls of greenish white flowers well above the smooth green leaves. The leaves are delightfully clove-scented and may be used either fresh or dried for seasoning soups, salads and cottage cheese; also in chopped meats and sausages. Basil has been in use for over 1000 years.

Pkt. 15c., 3 pkts. 35c.

8156 Borage (Annual). Pretty sky-blue flowers in clusters on branching plants with somewhat rough, hairy foliage. The young leaves, before the plants bloom, may be cooked like Spinach and the fresh foliage which has a cucumber flavor adds a cooling touch to salads.

Pkt. 15c., 3 pkts. 35c.

8167 Caraway (Hardy Biennial). Caraway is an attractive plant with feathery green leaves and umbels of yellowish white flowers. It is valuable because the foliage may be used in soups and salads; the roots boiled and eaten as a vegetable and the seeds are popular for flavoring.

Pkt. 15c., 3 pkts. 35c.

8189 Coriander (Annual). A slender branching plant which bears rose-tinted blooms which resemble "Queen Anne's Lace." Coriander is not hardy for its seeds which when ripe have a pleasant, pungent flavor and are used in flavoring cookies, cakes, poultry stuffings, sausages and confectionery. Sow where the plants are to grow; transplanting is difficult.

Pkt. 15c., 3 pkts. 35c.

8191 Dill (Annual). Fine cut, feathery foliage and umbels of greenish yellow flowers. An aromatic oil from the seeds is used in soaps and perfumes; the foliage flavors meat gravy, cottage cheese or potato salad and the seeds are used in pickles. Dill dislikes transplanting; sow where the plants are to grow.

Pkt. 10c., 3 pkts. 25c.

8224 Horehound (Perennial). An old-time sweet herb the name of which is only known to many from its use in cough medicines and hard candy. Horehound is an aromatic plant with woolly white foliage and bristly whorls of white flowers, in Summer. The dried leaves are the useful part.

Pkt. 25c., 3 pkts. 60c.

8246 Lavender (Perennial). While Lavender is a perennial, it is best to give the plants Winter protection. It is strongly aromatic and very ornamental being much used in borders and rock gardens. The flowers are lavender and the foliage gray. Grown also for its aromatic oil which is well known in perfumes.

Pkt. 25c., 3 pkts. 60c.

8257 Marjoram, Sweet (Treat as Annual). A perennial plant but best treated as an annual because it is not reliably hardy. Small but erect, bearing close heads of purplish blooms. The deliciously fragrant foliage is popular for scent bags and in powders, and the fresh leaves are much used in salads. Dried they may be used for seasoning meats, poultry or cheeses.

Pkt. 25c., 3 pkts. 60c.

8318 Sage (Hardy Perennial). A purple-flowered shrub with woolly whitish foliage. The fresh leaves may be chopped and used for flavoring sausage, cottage cheese or pickles. Dried and powdered they are used for sprinkling on roasted meats, in poultry stuffings and with certain cooked vegetables.

Pkt. 25c., 3 pkts. 60c.

8329 Savory, Summer (Annual). A fragrant little plant with slender leaves and pale lilac flowers. About flowering time the entire plant is cut and dried and the leaves are then used for flavoring salads, meats, stuffings and cooked vegetables.

Pkt. 15c., 3 pkts. 35c.

8367 Thyme (Hardy Perennial). An erect little shrubby plant with small, grayish green leaves closely set on small, wiry stems, and lavender flowers. Pkt. 25c., 3 pkts. 60c.

Lettuce

Time to Sow—If a very early crop is desired, seed may be sown about March 15 indoors in flats or in a coldframe; outdoors sowings may be made as early as April 1 and successively until about June 1. As Lettuce prefers cool growing weather it is best to discontinue sowings during the hot Summer months except for certain varieties. A Fall crop may be sown from August 1 to August 15.

Soil—Indoor sowings should be made in finely prepared loam. Any well-drained and enriched garden soil will suffice for outdoor plantings.

Planting—Sow the seeds outdoors in rows 2 feet apart and cover with not over $\frac{1}{4}$ inch of soil. When the plants are large enough to handle thin out and use or transplant to other rows, allowing 1 foot between plants. **1 ounce of seed should produce about 3000 plants**

Soil—Finely prepared loam is best for indoor starting. The garden soil should be generously manured and preferably light.

Planting—Melons should be grown in hills spaced about 4 feet apart each way. Plant 5 to 10 seeds in each hill and cover with not over ½ inch of soil. When the plants are well started thin out so that the strongest 3 or 4 remain in each hill.

1 ounce of seed will plant 60 hills

PEPPERS

Time o Plant—For an early crop the seed may be sown either in the house or in a coldframe in early April. However, seed sown from May 15 to June 1 in the open ground will produce a crop in late Summer.

Seed Sowing—Sow the seeds thinly in flats or in a coldframe in light pulverized soil. Cover them with not over $\frac{1}{4}$ inch of soil.

Soil Preparation—Any reasonably good, well cultivated garden soil, preferably ground that has been manured the previous year. Soil too rich in nitrogen will tend toward the production of foliage rather than fruit.

Transplanting—Seedlings started inside, should be transplanted as soon as they are large enough to handle, into boxes or individual pots and spaced far enough apart so that each will have ample space for development. These plants should be gradually hardened off by exposure to out-of-door conditions during favorable weather, before being permanently placed in the garden, about June 1. Set the plants $1\frac{1}{2}$ feet apart in rows leaving about 3 feet between the rows.

1 ounce of seed should produce about 2000 plants

1 ounce of seed will sow about 100 feet

6514 Breck's Guernsey. 100 days. A superior variety, light in color and smooth, fine-grained, sweet and tender. Pkt. 15c., $\frac{1}{2}$ oz. 30c., oz. 50c., $\frac{1}{4}$ lb. \$1.50

6514 Breck's Guernsey Parsnip

PARSLEY

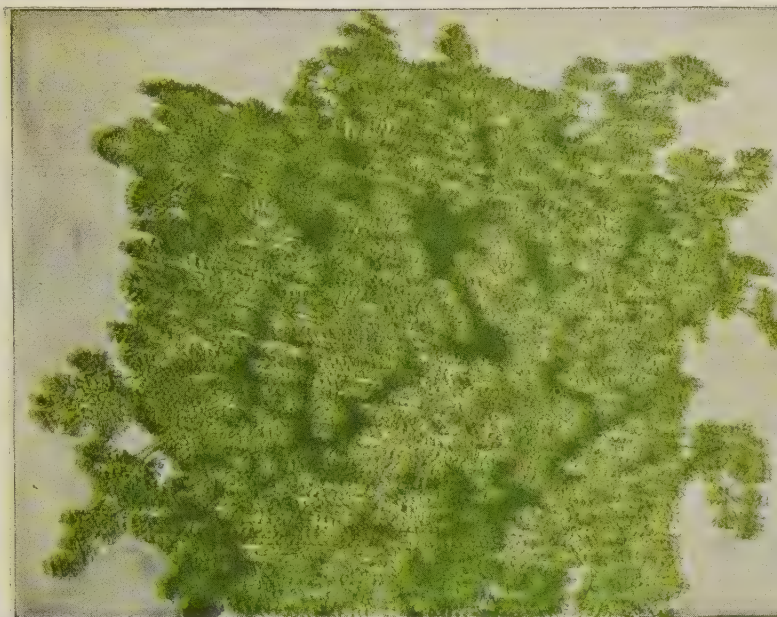

The seed may be sown from April 20 to about June 25 out of doors but if earlier plants are desired they should be started indoors or in a coldframe about March 15 and transferred to the open garden about May 1. The seeds germinate slowly, and care should be taken to press the soil firmly around them. Sow in rows $1\frac{1}{2}$ feet apart and cover the seed not more than $\frac{1}{4}$ inch. When large enough to handle, thin out to 2 inches apart. Any reasonably good garden soil will suffice.

1 ounce of seed will sow 150 feet

6476 Breck's Double Green Crest. 70 days. Dwarf, compact growth. Rich, dark green leaves, densely curled. The most desirable sort for exhibition or garnishing. Highly prized for garden borders, frames, or open ground. Pkt. 25c., $\frac{1}{2}$ oz. 60c., oz. \$1.00, $\frac{1}{4}$ lb. \$3.00

6476 Double Green Crest Parsley

GARDEN PEAS

Time to Plant—Just as early in the Spring as the soil is workable (about April 1).

Soil Preparation—Any good garden soil which has been deeply spaded and liberally manured. Peas dislike acid soil and if such a condition exists, it should be corrected by working in lime (about 5 lbs. to each 100 square feet).

Planting—Sow in drills, allowing one inch between seeds and about 3 feet between rows. Cover the seed with about one inch of soil.

Cultivation—As soon as they begin to grow, some form of support should be provided for all but the very dwarf varieties. (Birch brush or poultry wire.) Constant cultivation will add considerably to the quality of the crop.

1 lb. of seed will sow about a 50 foot row

Green Mountain Potatoes

Certified Potatoes

Aroostook Potatoes, certified as seed stock by the Maine Department of Agriculture.

Potatoes should be planted during April or early May. They will thrive in almost any fertile, well-drained, somewhat acid soil. Do not use lime. The soil should be plowed or deeply dug over and furrows 6 inches deep and $2\frac{1}{2}$ to 3 feet apart, should be made. A commercial fertilizer with high phosphorus and potash content should be thoroughly mixed with the soil at the bottom of the furrow (about 20 lbs. per 100 ft. row) and about 2 inches of unfertilized topsoil should be placed over it.

Cut each Potato into three or more pieces with at least one good eye to the piece. Treat with Semesan-Bel and plant, about 10 inches apart, in the prepared furrows. Cover with 3 or 4 inches of soil. Cultivate constantly throughout the season. (10 bushels are sufficient to plant one acre)

7043 New Zealand Spinach

Spinach

Time to Sow—For an early crop seed should be sown just as soon as the ground can be worked (about April 1) with successive sowings up to the end of May. This crop runs quickly to seed in hot, dry weather and therefore it is best not to plant again until about August 15 when a Fall crop of Spinach can be sown which will provide greens until frost.

Soil Preparation—Spinach, to be succulent and tender must have a really rich soil, well prepared and liberally manured.

Planting—Sow the seed thinly in rows; cover with not over $\frac{1}{2}$ inch of soil and allow $1\frac{1}{2}$ feet between rows. When the plants are large enough to handle, thin out, leaving about one inch between plants.

1 ounce of seed should sow a 50-foot row

A true cut-and-come-again vegetable, exceptionally valuable for Summer "greens." The plants are robust, of low spreading habit, extremely drought resistant and produce an abundance of small, thick, tender leaves. As this is not a true Spinach, the culture is somewhat different. The seeds may be sown from May 1 to July 1 and should be soaked in warm water a few hours before planting. Sow at a depth of $\frac{1}{2}$ inch and thin out to stand 2 feet apart. Pkt. 15c., $\frac{1}{2}$ oz. 45c., oz. 75c., $\frac{1}{4}$ lb. \$2.25

Squash

There are two distinct types, the Summer or bush type and Winter or vine type.

Time to Plant—Sow the seeds of Summer Squash from May 1 to July 1 and Winter Squash from May 1 to June 1.

Soil Preparation—Prepare the hills by spading in two or three shovelfuls of well-rotted manure to each hill. If this is not available, work in about a handful of commercial fertilizer to each hill.

Planting—It is best to sow from 6 to 8 seeds in each hill about $\frac{1}{2}$ inch deep. When these are well up, thin out, leaving only 2 or 3 of the strongest plants to grow in each hill. For Summer Squash allow about 4 feet each way between the hills and 7 feet each way for Winter varieties.

*1 ounce Summer Squash will plant about 50 hills
1 ounce Winter Squash will plant about 15 hills*

TOMATOES

Time to Sow—It is best to sow indoors in flats, or in coldframes, during April, but seed sown outdoors in early May will produce fruit in September.

Planting—When sowing use a good light sifted loam and broadcast the seed thinly over the surface, cover with not more than $\frac{1}{8}$ inch of soil. When the seedlings are from 2 to 3 inches high they should be given ample space for proper growth. Either transplant or thin out so that they will be about 3 inches apart. After all danger of frost is past these plants should be hardened off, by gradual exposure to the out-of-doors, during favorable weather; transplanting them to the garden about May 20th. Space the plants about 3 feet apart in the rows allowing 4 feet between rows. Closer planting is possible if the plants are to be staked.

One ounce of seed should produce about 1500 plants

TURNIPS and RUTA-BAGAS

Turnips are easy to grow. They will thrive in the Spring or Fall but will not do well during the heat of Summer. Seeds may be sown as early as the ground is workable (about April 1) with successive sowings until May 15. The Fall crop should be sown in August. Any reasonably good garden soil will suffice.

Sow in rows, 1½ feet apart and cover the seed with not over ¼ inch of soil. When the plants are about 3 inches high, thin them out to stand 3 inches apart. *These tender vitamin-rich plants should not be discarded, they make delicious greens.*

1 ounce of seed should sow a 150-foot row

TAMPALA

7079—A NEW VEGETABLE BETTER THAN SPINACH

Tampala is a delicious green vegetable which is cooked and served like Spinach. The entire plant may be used when it is 5 or 6 inches high or it may be allowed to develop into a plant of about 2 feet in height. If allowed to develop the leaves may be removed individually. The stems up to the size of one's little finger are excellent too, but they should be separated from the leaves and cooked 8 or 10 minutes longer as you would cook Asparagus. Tampala should be sown outdoors from early May until Midsummer. Sow thinly in rows and cover the seed with not over ¼ inch of soil. If the plants are to be used when small, thin out to 2 inches apart; or 12 inches apart if they are to develop fully.

Pkt. 15c.

Soil—Light, well-drained soil that has been thoroughly manured.

Planting—Melons should be sown in hills spaced about 8 feet apart, each way. Sow 5 to 10 seeds in each hill and cover with not more than one inch of soil. When well started thin out so that 3 or 4 of the strongest plants remain in each hill.

1 ounce of seed will plant about 30 hills

England

Grown

GLADIOLUS

The Gladiolus is unquestionably the most colorful, the easiest to grow and the most generally useful of all Summer-flowering bulbs. They may be planted in groups or worked in between annual or perennial plants in flower beds or in perennial borders, where they will add greatly to the color of the Midsummer garden. They may also be planted in rows between vegetables or tucked away in odd corners to grow and produce cutting flowers or to add color to otherwise drab spots. Plant a few this year. Our New England Collection provides an excellent beginning.
